(54) WAVEFORM QUALITY MEASURING METHOD FOR CDMA SIGNAL

(57)Abstract:

PROBLEM TO BE SOLVED: To improve measurement precision.

SOLUTION: A measurement signal $Z(k)$ of a base-band from an orthogonal conversion part 17 is demodulated by the PN code of a pilot signal in a demodulation part 25. The demodulation bit string and amplitude a^i is detected. An ideal signal R_i is generated from them and the PN code. Auxiliary data A, B, C, H and I for solving approximated simultaneous equations obtaining parameters for minimizing the square of the error of R_i and $Z(k)$ are obtained (26). Then, the simultaneous equations are solved from them and $Z(k)$. Parameters $\Delta a_i, \Delta t_i, \Delta \theta_i$ and $\Delta \omega$ are estimated (27). Thus, $Z(k), R_i, A, B, C, H$ and I are corrected by the finding of parameter estimation is repeated again until the parameter is optimized. Then, an electric coefficient ρ_i is obtained by $Z(k)$ and PN.
